Karol (Szpili)

AI systems builder

I build AI systems: agents, verification of model answers, and automations people actually use.

Profile

I design and ship systems where language models do something useful and checkable: agents that work inside Claude Code, verification of AI answers against sources, and automations that pull data from the real world (scrapers, OCR, bots). I take projects from an idea to a working product: backend, frontend, infrastructure, and docs in Polish and English.

Projects

Weryta — weryta.pl

A system of source-grounded AI answers.

- Each answer carries a label for how it relates to its source (e.g. ENTAILED) and a citation, for example from the Polish Journal of Laws. The fact store changes only on verified evidence.
- Fairy Dice (physix.weryta.com): a 1–2 click rating on two axes, truth and feeling, stored in an append-only ledger.

`source verification / entailment / append-only ledger / PL and EN`

deepseek-workers — github.com/Szpilmenik/deepseek-workers

A Claude Code plugin that hands mechanical work to DeepSeek V4 models.

- The dsclaude wrapper runs claude -p against an Anthropic-compatible endpoint, so DeepSeek gets the full agent toolset.
- A routing rule in CLAUDE.md sends simple chunks of every session and subagent to the cheaper model. The setup skill ends with a live end-to-end test.

`Claude Code / plugins and skills / DeepSeek API / cost routing`

HighScanner — highscanner.pl

A price tracker for medical cannabis in Polish pharmacies.

- Prices come from patients' receipts (OCR) and public sources. Photos showing a national ID or prescription number are rejected.
- An Android app, a Telegram bot and a Discord community. Website in Next.js 16 and Tailwind CSS 4 on Vercel.

`scrapers / OCR / Android / Telegram / Next.js`

Skola — skola.weryta.com

Class feedback on two axes instead of a single star.

- One tap on a 5×5 square: how much I learned and whether I liked it. No account, a one-time vote token, QR codes for teachers, a PHP and MySQL backend.

`PHP / MySQL / QR / privacy / i18n`

Mikrobotech AI — private project

A personal, single-user AI assistant.

- An OAuth 2.0 client with access to Google Calendar, Gmail, Drive and Contacts, running on its owner's machine.

`OAuth 2.0 / Google Workspace APIs / agent`

Knowledge base for agents — private project

Shared memory for several AI agents.

- Sync across devices, a nightly fact distiller, semantic search on local embeddings (Ollama) and portable agent skills with a risk rating.

`Python / Ollama / embeddings / RAG`

Skills

AI and LLMs
Claude Code (plugins, skills, subagents), Anthropic API, DeepSeek, Ollama, embeddings and semantic search, answer verification, routing work between models

Web
TypeScript, React, Next.js, Tailwind CSS, framework-free HTML, CSS and JavaScript, PHP, MySQL

Automation and data
Python, scrapers, OCR, Telegram bots, OAuth 2.0, Google APIs

Infrastructure
Linux, Git and GitHub, GitHub Pages, Vercel, Cloudflare, Tailscale, Syncthing, cron and systemd

How I work

> Only verified evidence changes what the system believes.

> A mistake is a new record, never an edit.

> A cheap model for mechanics, a strong model for judgment.

> Keep what is true apart from what is liked.

Languages

Polish: native
English: fluent, including technical writing
